

BIRLA INSTITUTE OF TECHNOLOGY AND SCIENCE

NCBI gene ID: WWOX

Organism : *Homo sapiens*

Full name: WW domain containing oxidoreductase

END-TERM PROJECT BIO-INFORMATICS (BIO F242)

Submitted to,

Prof. Shibasish Chowdhury

Ashish Kumar

Introduction: WWOX gene

WWOX gene encodes a member of the short chain dehydrogenases/reductases (SDR) protein family.

- Location – In Chromosome 16 spanning base pairs 78,099,654 to 79,212,667 i.e. 16q23.1 – q23.2.

(See Figure-1) →

- **Gene type**-_Protein coding. This gene produces a translated product which has important function as discussed below.
- **Organism**-_Homo sapiens
- The gene spans the FRA16D common chromosomal fragile site and appears to function as a tumour suppressor gene. FRA16D is within regions of frequent loss of heterozygosity in certain cancers, and is homozygous deletions of this 270kb FRA16D locus is reported in adenocarcinomas of stomach, lung and ovary.

WWOX protein: 1 WMV function

- 1 WMV is an oxidoreductase. In biological systems, an oxidoreductase acts as a catalyst for oxidation reduction reactions. The enzyme WMV transfers electron from one molecule, known as reductant to another known as oxidant, the electron acceptor.
- The **residue count** of 1 WMV is 54.
- The protein is an intracellular **protein**.
- **Molecular function of WWOX gene**-
 - Acts as a tumour suppressor gene and plays a role in apoptosis.
 - Required for a normal bone development

- Evidence has been obtained that the gene functions synergistically with p53/TP53 to control genotoxic stress-induced cell death.
- Plays a role in TGFB1 signalling and TGFB1-mediated cell death and also plays a factor in Tumour Necrosis Factor (TNF)-mediated cell death. The protein translocate to the nucleus upon genotoxic stress or TNF stimulation.
- Inhibits *Wnt* signalling, probably by sequestering DVL2 in the cytoplasm.
- Interacting proteins for WWOX Gene –

Gene Sequence

```

- The GC content of the DNA is <50%. Hence, one can infer that the gene is not thermostable.
- GC rich isochores typically include many protein coding regions within them. Existence of GC rich regions can be mapped to gene rich regions. In WWOX raw DNA sequence, about 42% of the sequence contains genes.
- The average GC-content in human genomes ranges from 35% to 60% across 100-Kb fragments, with a mean of 41%. The GC-content of Yeast (*Saccharomyces cerevisiae*) is 38%, and that of another common model organism, thale cress (*Arabidopsis thaliana*), is 36%.
- Because of the nature of the genetic code, it is virtually impossible for an organism to have a genome with a GC-content approaching either 0% or 100%. However, a species with an extremely low GC-content is *Plasmodium falciparum* (GC% = ~20%), and it is usually common to refer to such examples as being AT-rich instead of GC-poor.
- Our sequence is close to the mean of the Human beings which is in line to the data that the sequence is indeed from human beings.

mRNA sequence

Transcript variant – 3

➔ **Summary:** This variant is a non-coding RNA (ncRNA). This variant (3) is intron less and extends past a splice site that is used in variant 1. This variant is represented as non-coding because the predicted protein does not meet RefSeq quality criteria.

➔ The transcript is 546 bp linear transcribed RNA.

➔ **Sequence:**

```

➤ **Summary of the GC content in the RefSeq and transcript variants**

Sequence name	Length (bp)	GC content (%)
RefSeq Gene	1120014	42.65%
Transcript - 1	2242	51.38%
Transcript – 2	758	49.78%
Transcript - 3	546	65.97%
Transcript - 4	2176	50.74%
Transcript - 5	872	52.89%

➤ **Transcript variants combined analysis –**

○ We see that the ncRNA have higher GC content compared to the coding mRNAs. But according to prevalent literature, lncRNAs prevail in the nucleus and have a lower GC content. (**Source:** <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3312569/>).

- It has been mentioned in this (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4338330/>) paper that the exon region of lncRNA are GC rich whereas intronic regions are AT rich. Thus, combining the information from both the sources, we come to the conclusion that transcript variant – 3 has more of the exonic regions. The transcript variant-5 has lesser exonic region and more of the intronic regions.

Protein Sequence

(Source: NCBI WWOX RefSeq protein

https://www.ncbi.nlm.nih.gov/protein/NP_057457.1,NP_570607.1,NP_001278926.1)

➤ The NCBI web site lists down 3 protein sequence for the gene.

Isoform – 1

➔ The length of the protein is 414 amino acids.

➔ This is the longest isoform out of all the 3 isoforms produced from the transcripts.

➔ This isoform is coded by translation of the 2242 nucleotide transcript variant-1.

➔ **Sequence:**

→Structure →

➤ **Combined Analysis of isoform 1, isoform 2 and isoform 4-**

- The three isoforms have similar structures; hence I propose that the functions performed by the 3 isoforms must be similar by the **structure function hypothesis**.
- The residue count of the 1 WMV functional protein is 54 aa. This infers one to say that all the 3 isoforms, specifically, isoform 1, isoform 2, isoform 4 are subject to **post-translational modifications** as the length of final protein is less than the aa count of the isoforms.

Exons/Introns in the gene

- ➔ Exon count -10 (source NCBI).
- ➔ List of Exons, Protein coding regions in the exons from ncbi sequence text view –
- ➔

Exon Numb	Exon start	Exon end	Codin	CDS start	CDS end
Exon -1	78,099,654	78,099,885	CDS	78,099,779	78,099,885
Exon-2	78,108,424	78,108,488	CDS	78,108,424	78,108,488
Exon-3	78,109,779	78,109,836	CDS	78,109,779	78,109,836
Exon-4	78,114,977	78,115,155	CDS	78,114,977	78,115,155
Exon-5	78,164,184	78,164,291	CDS	78,164,184	78,164,291
Exon-6	78,386,861	78,386,949	CDS	78,386,861	78,386,949
Exon-7	78,424,871	78,425,056	CDS	78,424,871	78,425,056
Exon-8	78,432,489	78,432,753	CDS	78,432,489	78,432,753
Exon-9	79,211,608	79,212,667	CDS	79,211,608	79,211,796

- **Analysis of intronic regions -** We can clearly see from the table that the intronic sequence length vastly outnumbers the exonic sequence length. The gap between exon-8 and exon-9 exceeds 750,000 base pairs (Quarter of a million bps).

This might be paradoxical to the energy conserving nature of our cells as maintaining a large number of these non-coding sequences require vast energy investments from our body.

But having these intronic sequences have various evolutionary benefits which justifies the energy cost in maintaining them, such as –

- Introns regulate alternative splicing
- Introns harbor several kinds of noncoding functional RNA genes such as miRNAs, siRNAs, piRNAs.

- Introns act as a buffer to dampen the mutation ill effects on the exons.

Figure 1 (above)

Screenshot of the sequence view of WWOX gene (part from 79,210,470 – 79,212,810)

Green – Intronic sequence; Red – Coding Domain sequence;

Blue – Non coding mRNA which is after/before transcription stop site/transcription start site respectively

Splice sites of the exons

Exon number	Start splice site	End splice site
Exon – 1	GGC,GCA	CAA,GTA
Exon – 2	CAG,TCA	GAG,GTT
Exon – 3	CAG,ATT	TGA,GTA
Exon – 4	CAG,CCA	TAG,GTA
Exon – 5	TAG,GGT	TGG,GTA
Exon – 6	CAG,CAT	TGT,GTG
Exon – 7	CAG,GCC	TCG,GTG
Exon – 8	AAG,ATT	ATG,GTA
Exon – 9	CAG,CAA	TAA,GTG

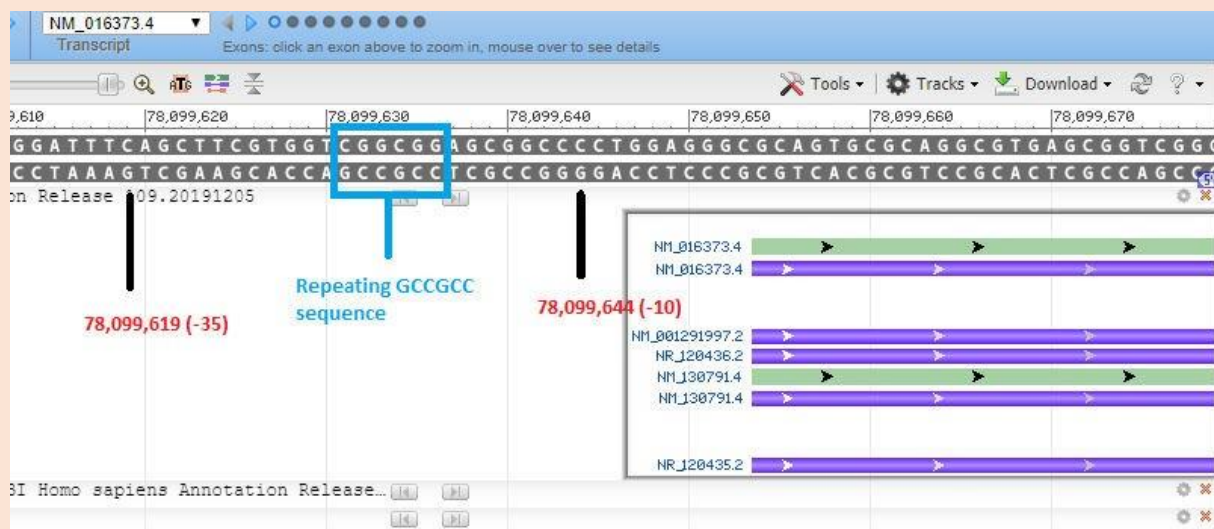

- Presence of **AG** at the acceptor splice of the intronic splice site. Acceptor site is the splicing site at the end of an intron, intron 3' right end.
 - Presence of **GT** at the donor site of the exonic splice site. Donor site is the splicing site at the beginning of an intron, intron 5' left end.
- Thus, the **GT/AG RNA rule is applicable for WWOX gene.**

Promoter regions of the gene

- **Procedure -** As told in the lab session, a promoter was looked from the ncbi site. The promoter sequence is a repeating sequence of at least three nucleotides present between the indices of -35 to -10 upstream of the gene WWOX.

In the Blue box enclosed is the twice repeating sequence **CGGCGG**, which is the sequence to which the promoter binds.

- The promoter sequence is unique in the sense, it does not contain a TATA box, a common feature to many promoters.
 - The promoter protein must spend a lot of energy to open the GCCGCC sequence to transcribe the gene.
- This gene might be transcribed at a lower rate due to presence of strong G-C bond at the promoter sequence.

- **5 prime flanking sequence –**
 - CCGCCTTCCTCTCCAGGCCCTGCCCCCTTTGACGCCGGCCG
TCGCGATATTGCGGAGACTGGATTTTCAGCTTCGTGGTCG
GCGGAGCGGCCCCCTGGAGGGC
- **3 prime flanking sequence –**
 - ATGCTTGAATATCATCACCTGAAGTTTGTATTGTTTCTTT
AAATGTTTGTTCAGTTTGT TTTTGT TTTTCATTTT TAGA
AAAGAAATCTAGAGGAAAAATAAA
- We can see the presence of many T's and A's at the end of the gene. This may be due to the fact that the flanking region immediately precedes the promoter region of gene after WWOX.

Dot-Plots

(Source: <https://www.bioinformatics.nl/cgi-bin/emboss/dotmatcher>)

1) WWOX gene self-plot

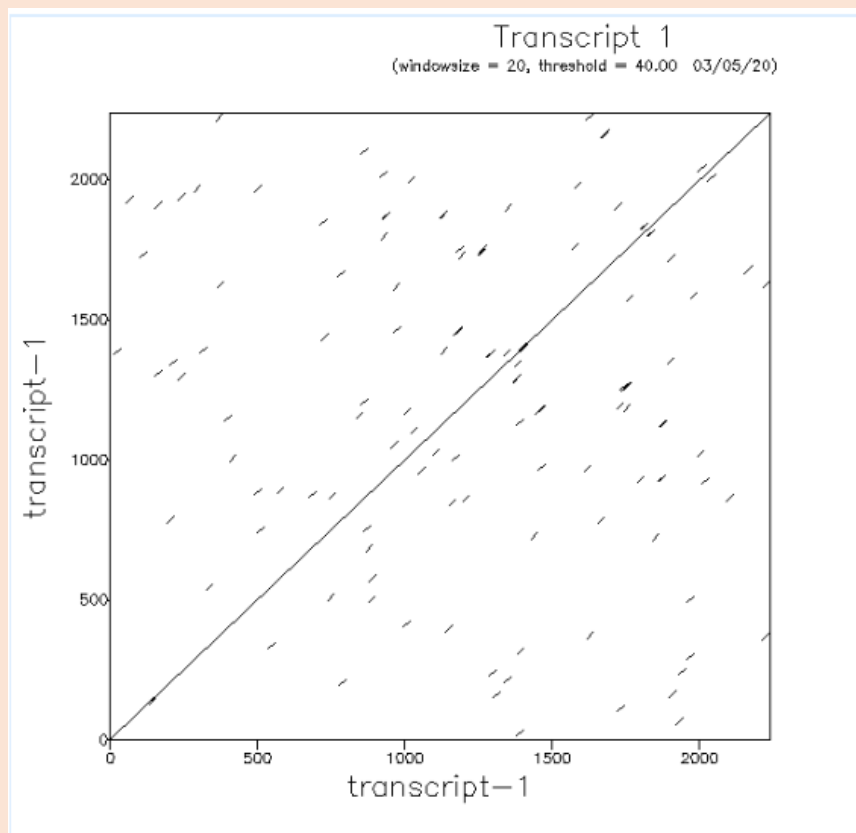

- The dot plot was performed by emboss dottup tool-

- The gene doesn't show any special features such as palindromic repeats, direct or indirect repeats in its dot plot.
- There exists none low complexity sites in my gene which is established by the absence of any box like regions in the dot plot.

2) Transcript Dot Plots

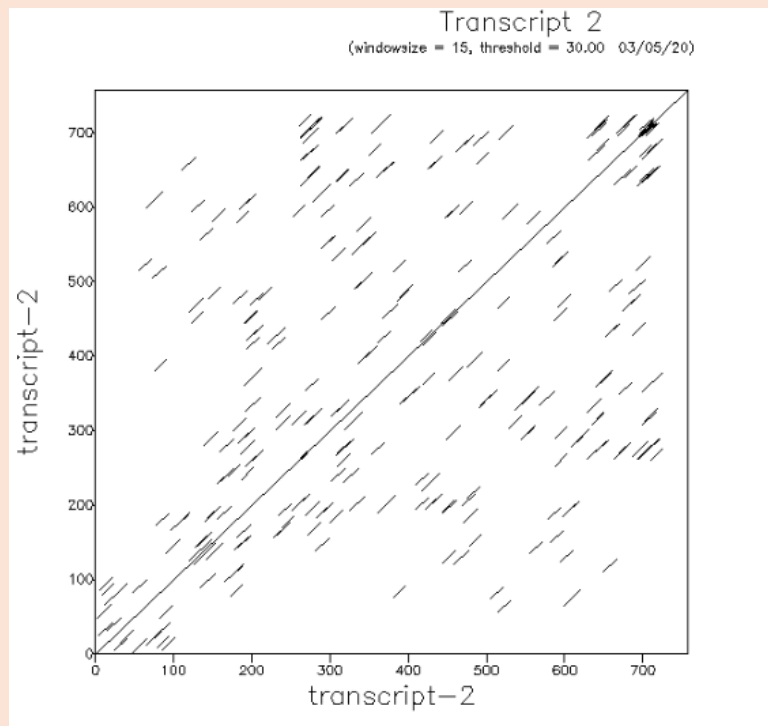

➤ Transcript- 1 dotplot:

- **Analysis –**

- The single diagonal exists because the sequences on the X and Y axis are exactly similar.

➤ **Transcript-2 self-dot plot:**

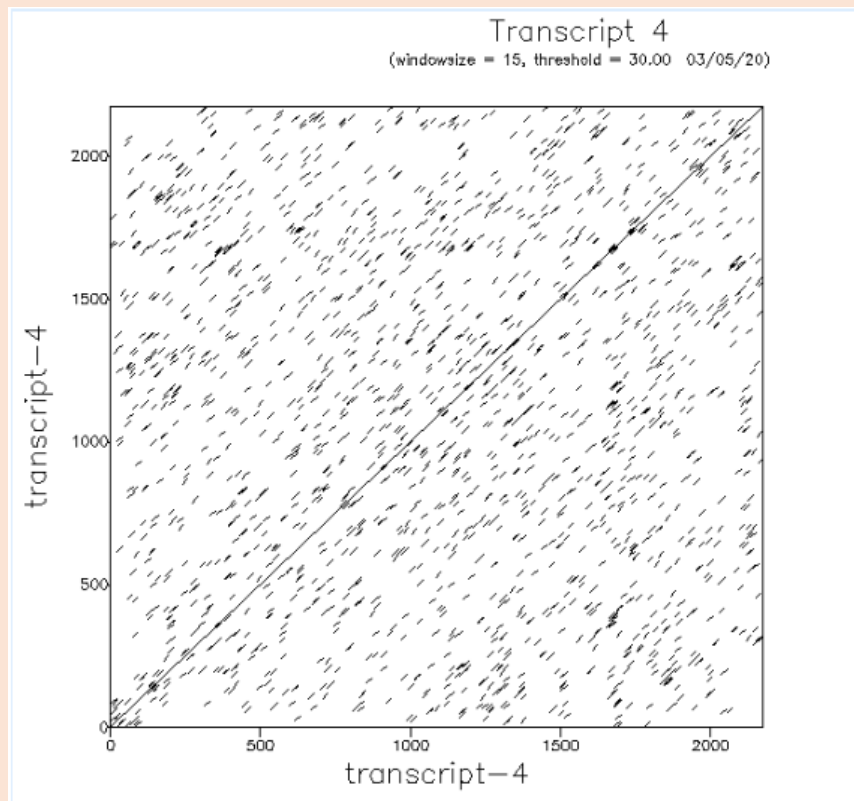

➤ **Transcript – 3 self-dot plot:**

- Transcript 3 indeed contains many repeats under stringent conditions.
- The two sides divided by the diagonal are symmetric due to the fact that the dot plots have been performed for two exactly similar sequence.

➤ **Transcript – 4 self dot plot:**

➤ **Transcript – 5 self dot plot:**

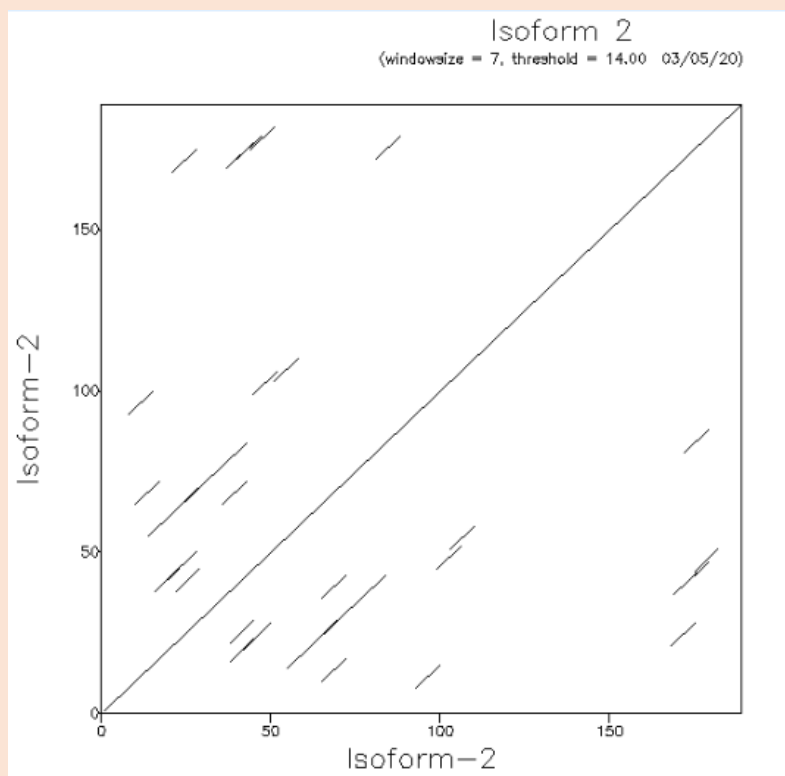

Protein sequence dot plots

- **Isoform 1 self-dot plot:**

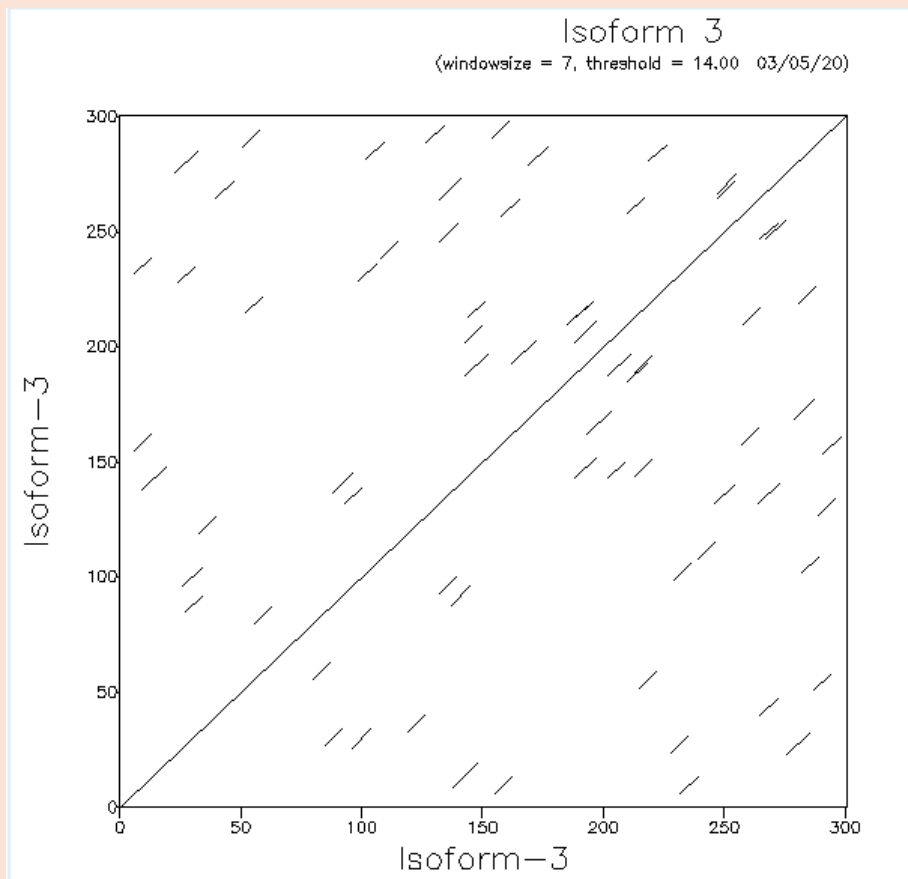

- **Isoform -2 self-dot plot:**

- We observe, that **isoform-2 has a repeated region between index 20-50 and 53-83**. The 30 aa length sequence are very close to each other.
- Upon inspection of transcript-2, which is the mRNA for Isoform-2, we should have found about 150 nt repeated sequence (in the plot, a straight line parallel to the diagonal extending for 150 nt).

But we find no such line parallel to the diagonal. Thus, the **repetition in the peptide is due to the codon degeneracy and not due to the transcript nucleotide degeneracy**.

- **Isoform 4 self dot plot:**

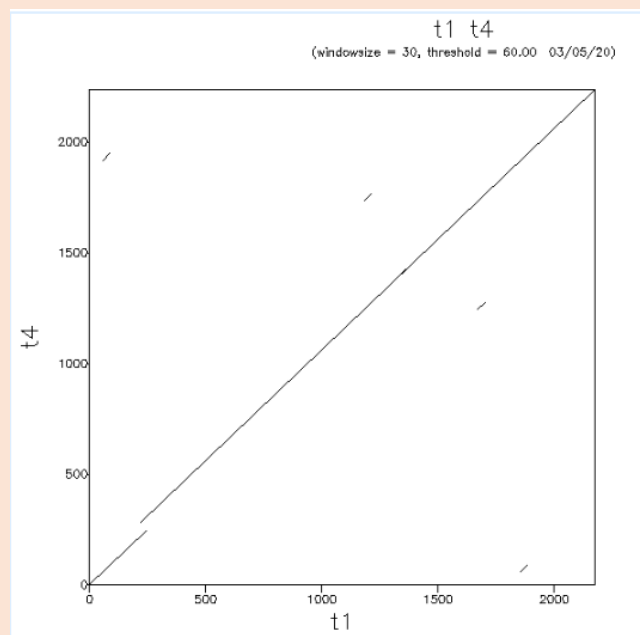

Cross Dot Plots (Between 2 different nt sequence pr different peptide sequence)

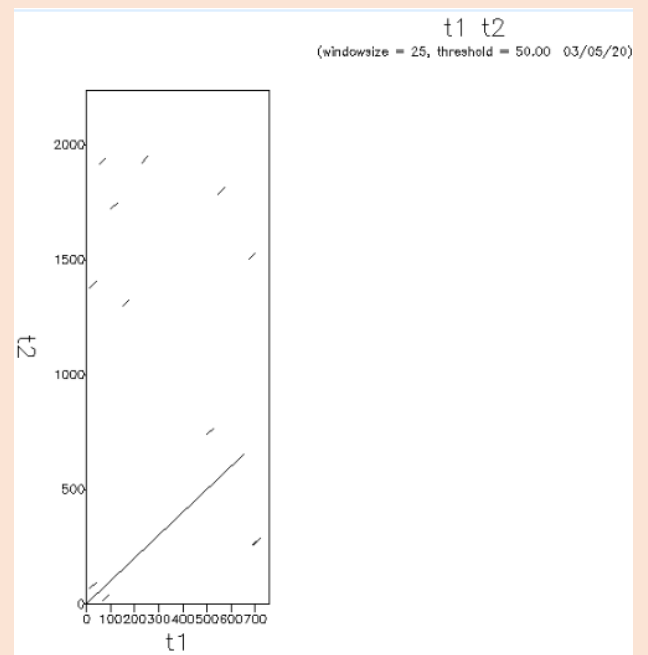

- (Isoform -1) (Isoform – 4) :Cross Dot Plot:

- Isoform 4 is exactly similar to peptide sequence indexed from 110-410 of isoform-4. Thus Isoform 4 is a truncated version of Isoform -1. This is because at index 110 of Isoform-1, the codon must be for methionine. If the tRNA carrying start codon, attaches at this position, then Isoform – 4 is formed, else Isoform -1 is formed. Transcript 1 and Transcript-4 too have a straight line almost passing through the diagonal except some insertions in t4 due to frameshifts around 250th nucleotide.

- The same is true for other cross plot also, Isoform -1 X Isoform-2.

- **Cross Plot for Isoform 2 X Isoform 4-**

Isoform cross

Transcript cross

- But the cross between (Iso-2 and Iso-4) has different results than both the crosses (Iso-1 X Iso-2) and (Iso-1 X Iso-4). We see that a large part of Isoform 4 is different from Isoform-2 in spite of their transcripts sharing approximately 700 nucleotides similarity.
- Thus, I propose that the **start codon for Isoform-2 somewhere around 500th nucleotide** in transcript-2 and for **Isoform -4 at around 700th index in transcript-4 in backward direction** for such dotplots.
- **Combined analysis of dotplots-**
 - We see a complete absence of –
 - Low complexity regions i.e. the regions having a redundant nucleotide or amino acid within a small region, in both the transcript and isoform dot plots. (As no box like structure present in dot plots).
 - Inverted repeats (No perpendicular line) and Palindromic regions in the dotplots.

Top 10 prokaryotic and eukaryotic organisms similar by BLAST method

BLASTn for gene

Top 10 eukaryotic organisms-

Mandrillus leucophaeus	1149	1149	0 %	0.0	94.30

➤ The BLASTn for the whole WWOX gene did not complete. So, instead of the whole gene, I took a **200k fragment of gene spanning from 780212667 to 78212667**. I

chose this fragment because it contains exon-9 which is used next for BLASTn to find prokaryotic matches. Moreover, for MSA and tree formation I needed to link the **200k fragment with exon-9**.

➤ Conclusion:

- Top 10 eukaryotic sequence match was obtained by BLASTn.

Top 5 prokaryotic organisms-

- The method adopted to get prokaryotic organisms is that we need to blast the exonic or coding sequences only, as the prokaryotic organisms are intron less and hence a full gene BLASTn would list them with a high E-value, and hence disregarding them from the database.
- First, from the *Gene* database of NCBI, I searched for *WWOX* gene. In the table of contents in the upper right corner, go to *NCBI Reference Sequences*.
(<https://www.ncbi.nlm.nih.gov/gene/51741#reference-sequences>).
- From the reference sequences, we could choose the transcript sequence for BLASTn.
- But, a more accurate approach would be to choose the exonic sequence as exons are continuous whereas the transcripts may be joined from many sequences.
- I chose Exon-9 as the sequence to do a BLASTn due to its longer length compared to other exons. **A longer length exon would have a more reliable data as the chances of random matches decrease exponentially with increase in the length of query sequence.**

```

- When *Expected threshold* = 10 and *low complexity regions are masked*, 0 hits were observed. Thus, we go to “*Algorithmic parameters*” in the BLASTn window in the bottom.
- Under “*Algorithmic Parameters*” –
 - **Short query sequences** - Increase the *Expected Threshold*, because short sequences may have expect value above threshold above default value 10, and hence may not be displayed.
 - **Filtering** - Some of the BLAST programs mask regions of low complexity by default. These regions are not allowed to initiate alignments, so if your query is largely low complexity, the filter may prevent all hits to the database. On the Basic BLAST pages, adjust the filter settings in the section '*Filters and Masking*', under '*Algorithm parameters*'.

➤ **Results- Match=2; Mismatch=-3; Gap-existence=5; extension=2**

<u>Organism</u>	<u>Max.</u> <u>Score</u>	<u>Total</u> <u>Score</u>	<u>Query</u> <u>cover</u>	<u>E-</u> <u>value</u>	<u>%</u> <u>identity</u>
Mycobacterium shinjukuense	48.2	48.2	4 %	0.9	83.33
Peptostreptococcaceae bacterium	48.2	48.2	3 %	0.9	89.47
Clostridium botulinum F str. 230613	46.4	46.4	3 %	3.1	91.18
Fusobacterium varium str NCTC10560	45.5	45.5	3 %	11	91.18
Bacillus velezensis str SGAir0473	45.5	45.5	3 %	11	86.49

- Only 5 top sequences were chosen, because of the low % identity of the sequences below. I had already decreased the stringency in the “*Algorithmic parameters*” before beginning the BLASTn. Thus, to prevent noise sequences from corrupting the data, I had to limit to top 5 prokaryotes.
- **Conclusion:**
 - My hypothesis behind lesser prokaryotic matches for WWOX is that, the WWOX protein 1 WMV has a complex tumour suppressor function in eukaryotes whereas in prokaryotes, it has oxidoreductase function only. Other enzymes for this such as *Molybdoxide oxidoreductase* exist which perform the same function.
 - Thus, this makes WWOX gene protein redundant and is found only in a handful of prokaryotes.

P.T.O

BLASTp for isoform-1

Eukaryotic matches

- I chose isoform-1 for BLASTp again because of its long size.
- Algorithmic parameters-
 - Expected Threshold = 100
 - Word size = 6
 - No masking and filtering of low complexity regions

➤ Results:

<u>Organism</u>	<u>Max. Score</u>	<u>Total score</u>	<u>Query cover</u>	<u>E-value</u>	<u>% identity</u>
Gorilla gorilla	867	867	99 %	0.0	99.76
Pongo abelii	867	867	100 %	0.0	99.28
Hylobates moloch	865	865	100 %	0.0	98.79

- **Conclusion for BLASTp:** - We immediately see that the query cover for prokaryotes dips in comparison to the eukaryotes. This is expected as prokaryotes and eukaryotes **diverged at least 1.5 billion years ago.**
- But, even after diverging, the primary function of WWOX gene protein remains oxidoreductase activity. In the prokaryotes, these enzymes perform the much important task of providing energy by ATP. In the eukaryotes, WWOX provides a tumour suppressor activity.
 - The conclusion is that proteins retain their specific activity by 2 mechanisms-
 - 1)** Dampening the mutation end effect because of codon degeneracy.
 - 2)** Elimination of organisms having mutation severely altering the protein function.

<i>Bacillus velezensis strain SGAir0473 (P)</i>	97.5	2.3 %

- The gene used for alignment with eukaryotic organisms was a part of the WWOX genome. I did this so that the time and the efficiency of the algorithm gets better. The

part used for alignment spanned from **79012667 – 79212667(200k base pairs)**. This span of gene contains the **exon-9** which is BLAST alignment to find the eukaryotes.

- For prokaryotic global alignment, **exon – 9** was used.
- E = eukaryotic organisms, P = prokaryotic organisms
- **Analysis and conclusion:**
 - The order of closeness of *Homo sapiens* with other organisms is different in the case of BLASTn and DP method. Example – *Papio anubis* has higher DP score than *Colobus angolensis* even though the latter is mentioned above in BLAST list. This might be because of the heuristic nature of BLAST.

- EMBOSS Needle reads two input sequences and writes their optimal global sequence alignment to file. It uses the Needleman-Wunsch alignment algorithm to find the optimum alignment (including gaps) of two sequences along their entire length.
- The scoring matrix used is EBLOSUM62
 - Default Gap opening score = -10.0
 - Gap extension score = -0.5

P.T.O

ClustalW MSA

MSA for gene

- To get better analysis of the MSA for WWOX, performed the following approach-
- As, the BLASTn query sequence was different for prokaryotes and the eukaryotes. For prokaryotes, query sequence was **exon-9**, whereas for eukaryotes, query sequence was a **200k fragment of WWOX spanning from 78500000 to 78700000**.
- Thus, we perform 2 different Clustal omega MSA, one with **exon-9** and other prokaryotic sequences and the second MSA of the **200k fragment of WWOX spanning from 78500000 to 78700000** with the eukaryotic sequences.

➤ ClustalW MSA for eukaryotic sequences, with the 200k fragment of WWOX + exon -9

- As we have BLAST for eukaryotes on **200k fragment** and prokaryotes on **exon-9** on different segments, we perform 2 different global alignments –
 - 1) MSA of all the sequences i.e. **200k fragment, exon-9**, top 5 prokaryotic BLAST, top 10 eukaryotic blasts.
 - 2) MSA of prokaryotic sequences and **exon-9**.

The 1st MSA of top 5 prokaryotic BLAST, top 10 eukaryotic BLAST, top 5 prokaryotic sequences, **exon-9, 200k fragment**.

The result was too long and empty. **Hence, I have written here the MSA with at least 2 sequences, rest all omitted parts was empty 200k fragment without any alignment.**

➤ Analysis and conclusion for Gene CLUSTAL omega:

- *Fusobacterium* and *Bacillus* align with intronic region instead of exonic-9 region due to a better alignment score. This can be ignored due to short size of the query sequence.
- We observe that the primates align better with the exonic sequence of human gene WWOX. They must be having similarity with the intronic regions too, but considering the alignment here, we can say the former. This concludes that **mutations in the exon region is quickly eliminated from race** whereas **mutation in intron region is not**. Lesser mutations mean better alignment.

➤ ClustalW MSA for prokaryotic sequences, with the exon-9 of Homo sapiens-

P.T.O

ClustalW MSA for protein

- For proteins, we need not perform different MSAs. This is because the proteins exist in all the organisms unlike DNA which has introns exclusively to eukaryotes.

➤ Analysis and conclusion:

- There is **not a single conserved site for the 15 species in the gene MSA**. But there exist **many conserved sites** in the protein MSA marked by *. There are exactly 36 conserved sites in the protein MSA.
- Thus, **proteins are conserved more compared to genes**. The mutations which don't alter the function of the protein are incorporated whereas others eliminated.
- Moreover, the regions of alignment for proteins and gene is different for both the MSAs. This can be attributed to codon degeneracy.

Evolutionary trees (Gene MSA)

➤ Maximum likelihood tree for genes (MEGA-X)

➤ **Neighbour Joining Tree for gene (CLUSTAL omega)**

➤ Maximum Parsimony tree for genes (MEGA-X)-

➤ Analysis and Conclusion:

- The exon-9 and the 200k fragment are rightly aligned closest in all the 3 methods.

- In the NJ tree, *Fusobacterium* has been shown to be close to the primates. But, in the ML tree, *Fusobacterium* has been grouped with prokaryotes. In case of such contrasting results, we go with the results of the ML tree as the math behind the ML tree better models the natural evolution. **NJ method is fast but ML method is more reliable.**
- Guidelines for the methods to use for phylogenetic trees-
 - NJ method is a heuristic method and it very quickly gives one an idea of the shape of the tree.
 - Use MP, again with bootstrapping to get an idea of character variation across the tree, in particular, which characters influence which branches.
 - Finally, use ML method to generate the final tree.
- Human WWOX gene has been most closely evolved from orangutan according to ML tree.

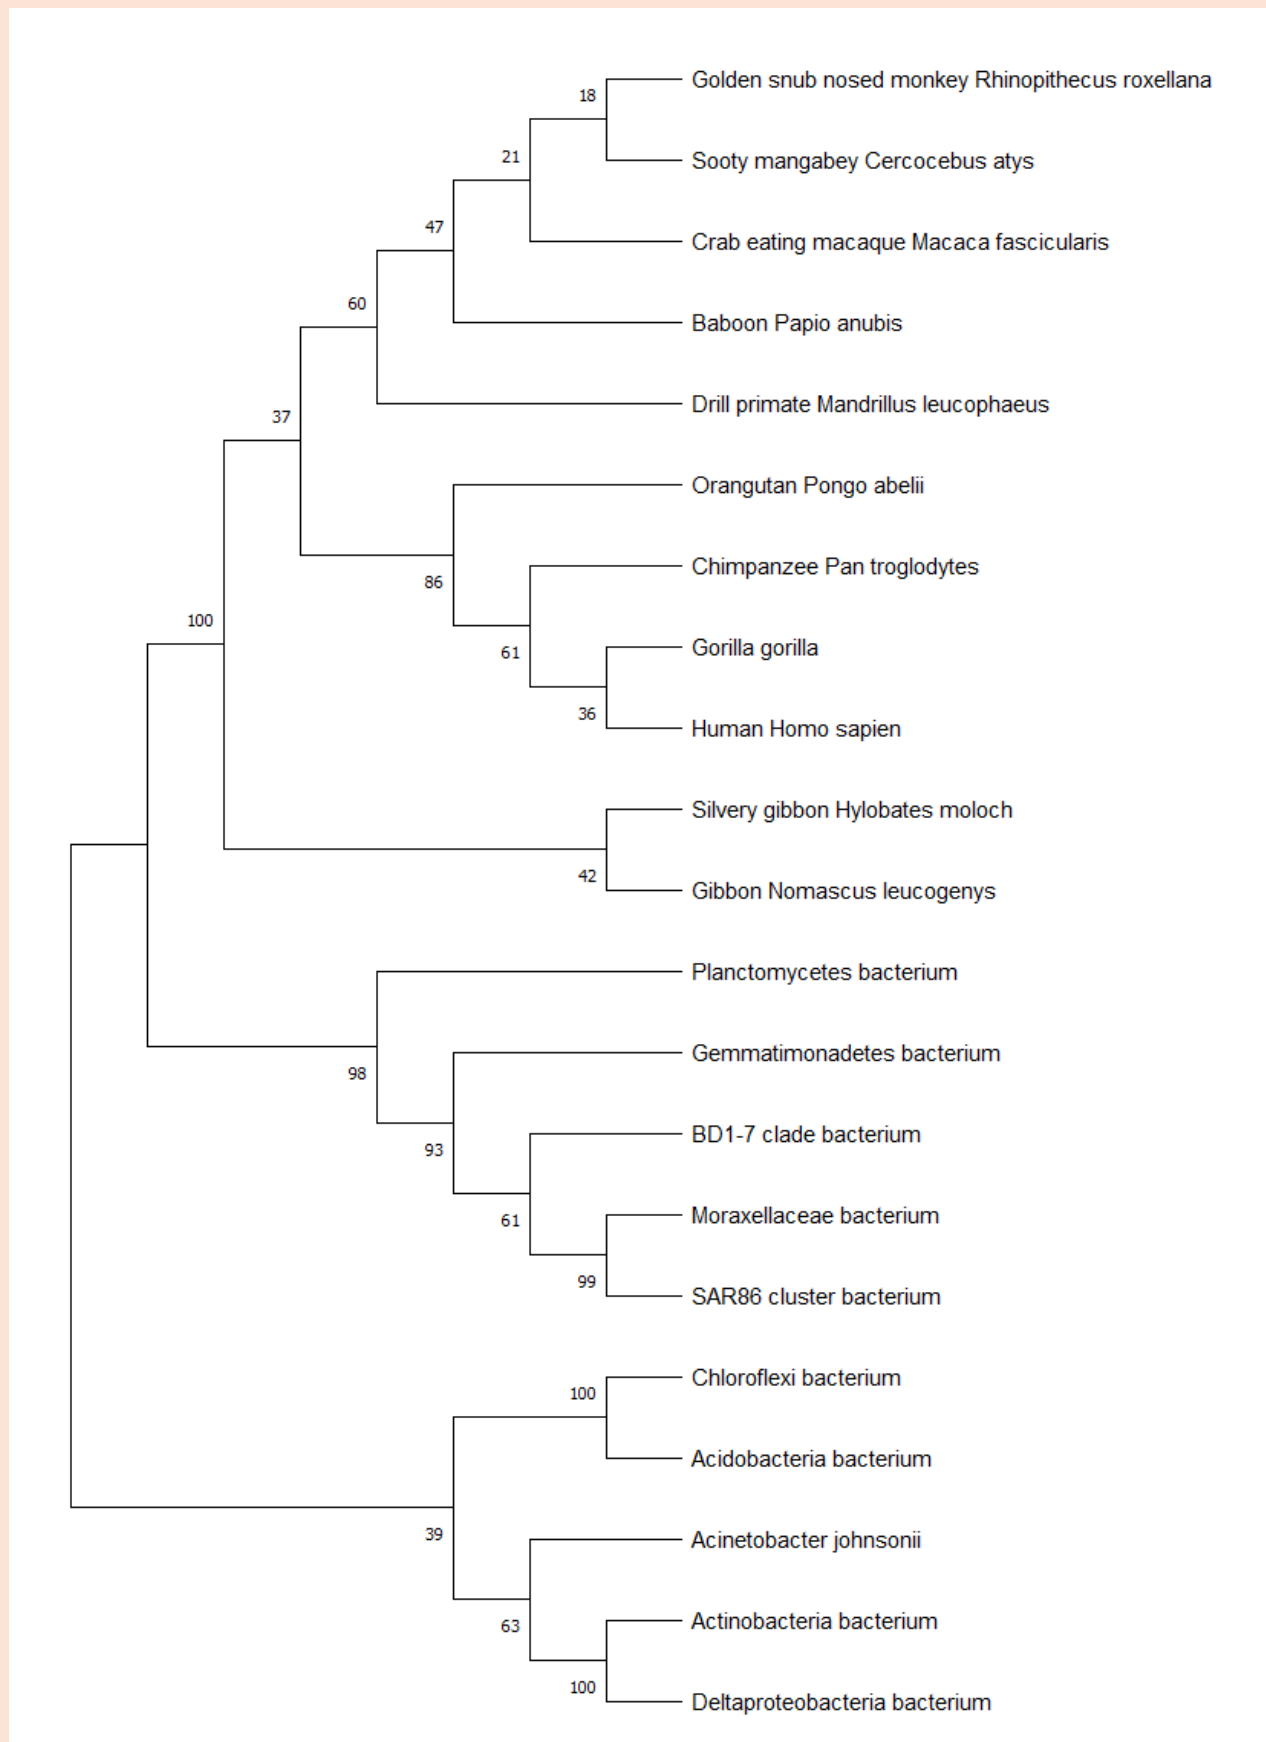

P.T.O

Phylogenetic trees for protein BLAST

➤ Maximum likelihood tree for proteins (MEGA-X)

➤ Neighbour joining tree for proteins (MEGA-X)

➤ Maximum parsimony tree for proteins (MEGA-X)

➤ **Analysis and conclusion for protein phylogenetic tree-**

- 1 WMV is predicted to be phylogenetically evolved from Gorilla by the ML tree.
- The phylogenetic tree for the protein is found to be different from the phylogenetic tree of the gene.
- Primates are clustered together, and the prokaryotes are clustered together.

P.T.O

ACKNOWLEDGMENT

I would like to thank Prof. Shibasish Chowdhury for giving me an opportunity to work on WW domain containing oxidoreductase as end term project
